## The Best Lunar Grazing Occultations in North America during 2023

The map below shows the paths of lunar grazing occultations for the 22 brighter stars and planets visible from much of North America in 2023. The events are limited to stars of magnitude 5.5 or brighter that will graze the limb of the Moon when it is at a favorable elongation from the Sun and at least as high above the horizon in degrees as the star's magnitude (e.g., a third-magnitude star is included only if its altitude is at least $3^{\circ}$ ). Some stars fainter than mag. 5.5 are included, to provide a good geographical distribution of paths. The map is a "false" projection, since the latitude and longitude scales are both linear. This makes it much easier for measuring coordinates or plotting locations with known coordinates than is possible with any other type of projection. The longitude scale is compressed by a factor of $\cos 50^{\circ}$. The maps are not detailed enough for locating oneself in the 2- or 3-km-wide zone where multiple disappearances of the star may occur. To obtain detailed predictions of any graze for plotting on larger-scale maps of your region, write to IOTA at PO Box 20313, Fountain Hills, AZ $85268-0313$ or better, send an email to business@occultations.org. For some grazes, IOTA overlays the predicted limit line on the very detailed maps and imagery of maps.google.com, but further corrections are needed based on the predicted lunar profile and the observer's height above sea level. A Web .htm file to do this is generated by IOTA's Occult4 program available free at http://www.lunar-occultations.com/iota/occult4.htm . The height above sea level in the area where the graze will occur, needs to be specified when generating the .htm file.

The 2023 month and day of month, and the star or planet's name or number are given along each track on the map. Conditions are represented by three different types of lines:
solid line = dark limb, night; dashed line = bright limb, night; and dotted line, dark or bright limb, day.
The best lunar grazing occultations in North America during 2023

Thicker lines are drawn for first-magnitude stars and planets. Many tracks begin and/or end with the letter $A, B$, or $S$ : A denotes that the Moon is at a low altitude, $B$ that the bright limb interferes, and $S$ that sunlight or twilight interferes. The tick marks along the tracks indicate multiples of 10 min of every hour. For
example, if the time for the west end of the track is $3: 16.2$, the tick marks proceeding eastward correspond to 3:20, 3:30, etc. Time always increases from west to east along the path. The time ticks are on the side of the limit with an occultation, that is north of southern limits and south of northern limits. The locations for the North American standard stations for lunar total occultation predictions given on pages 162-171 of the 2023 Handbook are indicated by asterisks on the graze map. 248 grazes are shown on six maps and tables, similar to what we published in the Handbook for previous years, at track on the map.

## Table of the best lunar grazing occultations in North America during 2023

| Date | Object <br> Name | ZC/SAO | d m | \%sl | L | $\begin{aligned} & \text { W.U.T. } \\ & \text { h m } \end{aligned}$ | Lo. | La. |

| Dec. 16 | 33 Cap | ZC 3130 | 5.4 | 19+ | S | 2324.5 | -89 | 21 |
| Dec. 19 | $\psi^{1} \mathrm{Aqr}$ | ZC 3419 | A 4.2 | 40+ | S | 07.8 | -113 | 41 |
| Dec. 19 | 27 Psc | ZC 3526 | A 4.9 | 50+ | S | 2018.1 | -59 | 45 |

The columns of the table above are explained below:

| Date | The 2023 date |
| :---: | :---: |
| Object name .... | Planet name, or star's proper name, Bayer Greek letter or Flamsteed number |
| ZC/SAO ........ | The star's ZC or Smithsonian Astrophysical Observatory (SAO) catalogue number |
| d | Double star code (if the star is double or triple) - see below |
| m | The star's visual magnitude |
| \%sl | the percent of the Moon sunlit (+ for waxing, - for waning, E for lunar eclipse*) |
| L | whether the track is a northern ( N ) or southern ( S ) limit |
| W.U.T. | the Universal Time at the west end of the track |
| Lo., La. . . . . . . . | the longitude and latitude of the west end of the track |

## Occulted stars known to be double

In the table below gives data for double stars for which graze predictions are given, either on the map and table above, or on the maps and tables of the 248 grazes portrayed elsewhere on this Web page. The information is from DSFILE, a comprehensive file of zodiacal double-star data compiled by Don Stockbauer, Henk Bulder, Mitsuru Sôma, David Herald, and David Dunham; most of the data for the ZC stars are in the Sato ZC catalogue. The successive columns give the ZC number of the star, the 2023 graze date, the double star code (d), the magnitudes of the brighter ( $A$ ) and fainter ( $B$ ) components, the separation in arcseconds, and the position angle (PA) of B from A measured eastward from north. If the star is triple, the third component's magnitude is given under C, and its separation and PA from A are given in the last columns.

The parameters are given for the epoch of the occultation, computed from orbital elements when available or from extrapolations from a long series of observations. If there is little change in the available observations, the last-observed separation and PA are used. Most components fainter than magnitude 12.0 are not listed, and some very close doubles whose parameters are not known, generally with separations less than $0.2^{\prime \prime}$, are also not listed. The latter include spectroscopic binaries (code U , or sometimes V ) and visual occultation doubles (most codes K and X , and many Vs).

The codes have the following meanings:
A...........Visual double listed by Aitken and/or Burnham (ADS, BDS)

C ............. Visual double listed by Innes, Couteau, or other visual observers
D........... primary of wide pair; secondary has separate catalogue entry
H........... triple, with close occultation pair and third visual component; prediction uses a mean position (J,U,orV \& M)
K...........U or V, but duplicity doubtful, only reported "gradual" from a past visual occultation observation
L............ close triple star (only two stars often listed because inner pair is often spectroscopic; J or U, \& V; all V; or all J)
M.......... mean position (centre of light) of a close pair is used by the ZC and/or XZ catalogue
O............orbital elements available and used to calculate the separation and PA
U........... Double, separation $0.05^{\prime \prime}$ or less, usually a 2-line spectroscopic binary

V ........... Close double discovered by occultation or by interferometry
Y ...........triple, K or X (visual A component) and A or C (C component)
Z ........... triple, O (A/B components) and V (C component) (O and A or C, or V or X or L)
Many close pairs have rapid orbital motion such that the current separation and/or PA is unknown, and they are then not listed in the table below.

| ZC\# | $\begin{aligned} & 2023 \\ & \text { Date } \end{aligned}$ | d | A | B | Sep. | $\underset{0}{\mathbf{P A}}$ | C | $\underset{\sim}{\text { Sep. }} \mathbf{P A}$ |  |  | Notes |

Will also be occulted Dec. 19

The lines in the double star table in bold type are for grazes shown on the map on the first page of this document.

## Names of occulted stars

The stars that are occulted by the Moon are stars that lie along the zodiac; hence they are known by their number in the Zodiacal Catalogue ( ZC ) compiled by James Robertson and published in the Astronomical Papers Prepared for the Use of the American Ephemeris and Nautical Almanac, Vol. 10, Part 2 (U.S. Government Printing Office, Washington, 1940). Robertson's ZC has been out of print for many years. In 1986, Isao Sato, a member of the Lunar Occultation Observers Group in Japan, republished the ZC. This new edition is based on the epoch J2000 and includes much new data, particularly on double stars. Since stars are not usually recognized by their ZC numbers, the Bayer designations or Flamsteed numbers of the stars occulted during 2023 are given in the table below. The ZC and larger XZ (now version XZ80Q) catalogues, updated in 2018 by D. Herald using Gaia data, are available through IOTA's website.
